

Recall: k : alg. closed field

$$V(\mathcal{I}) := \{a \in k^n \mid f(a) = 0 \forall f \in \mathcal{I}\}$$

$$\mathcal{I}(V) = \{f \in k[x_1, \dots, x_n] \mid f(a) = 0 \forall a \in V\}$$

$$\sqrt{\mathcal{I}} = \{f \in k[x_1, \dots, x_n] \mid f^n \in \mathcal{I} \text{ for some } n \geq 0\}$$

Nullstellensatz (strong form): $\mathcal{I}(V(\mathcal{I})) = \sqrt{\mathcal{I}}$

Moreover, we have inverse bijections

$$\begin{array}{ccc} \text{alg. varieties} & \xrightarrow{\mathcal{I}} & \text{radical ideals} \\ V \subseteq k^n & \xleftarrow{V} & \mathcal{I} \subseteq k[x_1, \dots, x_n] \end{array}$$

Weak form:

Let $\mathcal{I} \subseteq k[x_1, \dots, x_n]$ be an ideal. Then $V(\mathcal{I}) = \emptyset$ if and only if $1 \in \mathcal{I}$ (and so $\mathcal{I} = k[x_1, \dots, x_n]$)

Moreover, we have inverse bijections

$$\begin{array}{ccc} \text{points} & \xrightarrow{\mathcal{I}} & \text{max'l ideals} \\ a \in k^n & \xleftarrow{V} & \mathcal{I} \subseteq k[x_1, \dots, x_n] \end{array}$$

$$\left[\text{Last time: irred. vars.} \begin{array}{ccc} \xrightarrow{\mathcal{I}} & \text{prime ideals} \\ \xleftarrow{V} & \mathcal{I} \subseteq k[x_1, \dots, x_n] \end{array} \right]$$

Lemma:

a) $I(a) = (x_1 - a_1, \dots, x_n - a_n)$

b) $I(a)$ is maximal

Pf: $J := (x_1 - a_1, \dots, x_n - a_n) \subseteq I(a)$, so we'll prove that J is max'l. Under the quotient map $k[x_1, \dots, x_n] \rightarrow k[\dots]/J$, $p(x) \mapsto p(a)$, so $k[x_1, \dots, x_n]/J \cong k$, a field, so $J = I(a)$

□

Prop: Every max'l ideal is of the form $I(a)$ for some $a \in k^n$

Pf when k is uncountable (e.g. \mathbb{C} , not $\overline{\mathbb{Q}}$ or $\overline{\mathbb{F}_p}$):

Let $I \subseteq k[x_1, \dots, x_n]$ be a max'l ideal, and let

$F = k[x_1, \dots, x_n]/I$. $k \subseteq F$ since $k \cap I = 0$, so either

$F = k$ or F is a transcendental ext'n of k . In the

former case, $I = I(a) = I((a_1, \dots, a_n))$ where $x_i \mapsto a_i$.

In the latter case, $\dim_k F$ is at most countable since $\dim_k k[x_1, \dots, x_n]$ is countable, and the quotient map is

a vector space homom. On the other hand, let $t \in F$

be trans. / k . Now,

$\left\{ \frac{1}{t-a} \mid a \in k \right\}$ is an uncountable linearly indep. set,
a contradiction. □

Pf: If $\frac{c_1}{t-a_1} + \dots + \frac{c_n}{t-a_n} = 0$, then

$$c_1(t-a_2)\dots(t-a_n) + \dots + c_n(t-a_1)\dots(t-a_{n-1}) = 0,$$

and setting $t=a_i$ shows that each $c_i=0$

Pf of weak Nullstellensatz: Every proper ideal \mathcal{I} is contained in a max'l ideal $\mathcal{I}(a)$ (don't need Zorn's lemma since ring is Noetherian). If $V(\mathcal{I}) = \emptyset$, then $V(\mathcal{I}(a)) = \emptyset$, but this contradicts the fact that $V(\mathcal{I}(a)) = \{a\}$. □

Pf of strong Nullstellensatz: Already proved $\sqrt{\mathcal{I}} \subseteq \mathcal{I}(V(\mathcal{I}))$ (lecture 36).

Since $k[x_1, \dots, x_n]$ is Noetherian, \mathcal{I} is finitely-generated i.e. $\mathcal{I} = (f_1, \dots, f_m)$. Let $g \in \mathcal{I}(V(\mathcal{I}))$. Introduce a new variable x_{n+1} , and consider

$$\mathcal{I}' = (f_1, \dots, f_m, x_{n+1}g - 1) \subseteq k[x_1, \dots, x_{n+1}]$$

For any $a \in k^{n+1}$, if $f_1(a) = \dots = f_n(a) = 0$, then also $g(a) = 0$ (since $g \in \mathcal{I}(V(\mathcal{I}))$), so $x^{n+1}g - 1 \neq 0$. Thus, $V(\mathcal{I}') = \emptyset$.

By the weak form of the Nullstellensatz, $1 \in \mathcal{I}'$, so

$$1 = h_1 f_1 + \dots + h_m f_m + h_{m+1} (x_{n+1} g - 1) \text{ for some } h_i \in k[x_1, \dots, x_{n+1}]$$

Let $y = x_{n+1}^{-1}$, and multiply by y^N , $N \gg 0$:

$$y^N = p_1 f_1 + \dots + p_m f_m + p_{m+1} (g - y) \text{ for some } p_i \in k[x_1, \dots, x_n, y]$$

Plug in $y = g$:

$$g^N = \tilde{p}_1 f_1 + \dots + \tilde{p}_m f_m \in \mathcal{I} \subseteq k[x_1, \dots, x_n]$$

$$\text{where } \tilde{p}_i(x_1, \dots, x_n) = p_i(x_1, \dots, x_n, g) \in k[x_1, \dots, x_n]$$

So $g \in \sqrt{\mathcal{I}}$, and so $\mathcal{I}(V(\mathcal{I})) = \sqrt{\mathcal{I}}$.

□

If time: coordinate ring

Def: The coord. ring of a variety V is

$$k[V] = \{f: V \rightarrow k \mid f = g|_V \text{ for some } g \in k[x_1, \dots, x_n]\}$$

i.e. $k[V] = k[x_1, \dots, x_n] / \mathcal{I}(V)$

Since $\mathcal{I}(V)$ is the kernel of the ring homom.

$$k[x_1, \dots, x_n] \rightarrow k[V]$$

Cor of previous results:

a) V irred $\Leftrightarrow k[V]$ int. domain

b) V pt. $\Leftrightarrow k[V] \cong k$

c) For any variety V ,

$$\{\text{pts in } V\} \xleftrightarrow{\text{bij.}} \{\text{max'l ideals in } k[V]\}$$

Af: a) V irred. $\Leftrightarrow I(V)$ prime $\Leftrightarrow k[V] = k[x_1, \dots, x_n] / \mathfrak{I}$
int. domain

b) V pt. $\Leftrightarrow I(V)$ maximal $\Leftrightarrow k[V] = k[x_1, \dots, x_n] / \mathfrak{I}$
field

(and this field $\cong k$ since we know $\mathfrak{I} = \mathfrak{I}(a)$ for some $a \in k$)

c) By the 4th ring isom. thm., for a ring R and ideal \mathfrak{I} ,

$$\{\text{ideals in } R \text{ containing } \mathfrak{I}\} \xrightarrow{\text{bij}} \{\text{ideals in } R/\mathfrak{I}\}$$

Maximality is preserved under this bijection,

so combine this w/ the weak Nullstellensatz \square
