

More precisely,

$$[K : \text{Fix } H] = |H| \text{ and } \text{Aut}(K/\text{Fix } H) = H$$

First, given $\alpha \in K$, let's construct $m_{\alpha, F} \in F[x]$.

Let

$$H\alpha := \{\sigma(\alpha) \mid \sigma \in H\} =: \{\alpha = \alpha_1, \dots, \alpha_n\}$$

← →
distinct

We know that $\alpha_1, \dots, \alpha_n$ are roots of $m_{\alpha, F}$,

so set

$$f(x) = \prod_{1 \leq i \leq n} (x - \alpha_i) \in K[x]$$

← not a priori $F[x]$

If $f(x) \in F[x]$, then $f = m_{\alpha, F}$.

Claim: This is indeed the case.

Pf: Let $f(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0$.

If $\tau \in H$, then $\tau(\alpha_i) = \tau(\sigma(\alpha)) = (\tau\sigma)(\alpha) = \alpha_j$,
so τ permutes the α_j .

Then,

$$\tau(a_n)x^n + \dots + \tau(a_1)x + \tau(a_0)$$

$$= \tau(f(x)) = \tau(\prod(x - \alpha_i)) = \prod(x - \tau(\alpha_i))$$

$$= \prod(x - a_i) = f(x) = a_n x^n + \dots + a_0,$$

so $a_i \in \text{Fix } H = F$, so $f = m_{\alpha, F}$. \square

Def: In the case where $H = \text{Gal}(K/F)$ (by the thm. this will always hold), the elts. of $H\alpha$ are called the Galois conjugates of α .

Ex: $K = \mathbb{Q}(\sqrt{2}, i)$, $\text{Aut}(K/\mathbb{Q})$

$$H := \text{Gal}(K/\mathbb{Q}) = \{1, \sigma, \tau, \sigma\tau\} \quad \begin{array}{l} \sigma: \sqrt{2} \mapsto -\sqrt{2} \\ \tau: i \mapsto -i \end{array}$$

Let $\alpha = i + \sqrt{2}$

$$H\alpha = \left\{ \underset{\alpha_1}{\sqrt{2} + i}, \underset{\alpha_2}{-\sqrt{2} + i}, \underset{\alpha_3}{\sqrt{2} - i}, \underset{\alpha_4}{-\sqrt{2} - i} \right\}$$

and

$$m_{\alpha, \mathbb{Q}}(x) = \prod(x - \alpha_i) = x^4 - 2x^2 + 9$$

Focus: char 0 and finite fields

Let $K = \mathbb{F}_{p^n}$ = splitting field of $x^{p^n} - x$ over \mathbb{F}_p

Prop: Let $f(x) \in F[x]$ be irred of deg. n . Then

$$L := F[x]/(f) \cong K$$

Pf: Since $\deg f = n$, $[L:F] = n$, so $|L| = p^n$

$$\left(L = \{c_1 \alpha_1 + c_2 \alpha_2 + \dots + c_n \alpha_n\} \right)$$

↙ ↖ ↗
basis

By uniqueness of \mathbb{F}_{p^n} , $L \cong K$. □

Thm: $K^\times = K \setminus \{0\}$ is a cyclic gp.
↖ mult gp.

Pf: By the Fundamental thm. of abelian gps.,

$$K^\times \cong \mathbb{Z}/n_1\mathbb{Z} \times \dots \times \mathbb{Z}/n_k\mathbb{Z} \quad \text{where } d := \gcd(n_1, \dots, n_k) > 1$$

Suppose $k > 1$, and consider the roots in k^\times of $x^n - 1$.
 Everything in $\mathbb{Z}/n_1\mathbb{Z}$ is such a root, and so is
 $\frac{n_2}{d} \in \mathbb{Z}/n_2\mathbb{Z}$. But this is more than n_1 roots for a
 poly. of deg. n_1 . \square

Cor (Primitive elt. thm for finite fields): Any ext'n K/F w/
 K finite is simple.

Pf: $K = F(\gamma)$ where γ is any generator of the cyclic
 gp. K^\times . \square

Cor: $\text{Aut}(\mathbb{F}_{p^n}) = \text{Aut}(\mathbb{F}_{p^n}/\mathbb{F}_p) \cong \mathbb{Z}/n\mathbb{Z}$

w/ generator $\text{Frob}_p: \alpha \mapsto \alpha^p$, and this ext'n is Galois.

Pf: From D&F Problem 13.6.10, $\langle \text{Frob} \rangle \cong \mathbb{Z}/n\mathbb{Z} \leq \text{Aut}(\mathbb{F}_{p^n})$.

Conversely, since \mathbb{F}_{p^n} is the splitting field of the sep.
 poly. $x^{p^n} - x$, $\mathbb{F}_{p^n}/\mathbb{F}_p$ is Galois and

$$|\text{Aut}(\mathbb{F}_{p^n}/\mathbb{F}_p)| = [\mathbb{F}_{p^n} : \mathbb{F}_p] = n. \quad \square$$

Pf of thm when $\text{char } K = 0$ or K : finite.

If $\alpha \in K$, then $m_{\alpha, F}(x) = \prod_{\beta \in G\alpha} (x - \beta)$, so

$$[K:F] = [F(\alpha):F] = \deg m_{\alpha, F} = |H\alpha| \leq |H|.$$

Now, if α is a prim. elt. for K/F i.e. $K = F(\alpha)$, then we have

$$\underbrace{|H|}_{(c)} \leq \underbrace{|\text{Aut}(K/F)|}_{(a)} \leq \underbrace{[K:F]}_{(b)} \leq |H|.$$

Therefore, these are all equalities and so

(a) K/F is Galois

(b) $[K:F] = |H|$

(c) $\text{Gal}(K/F) = H$

□
